# 1 BLOCK DIAGRAM

## 2 ARCHITECTURE

The main processor is a TMS320C6713B with a system clock up to 288MHZ.

Other board resources include:

- Up to 32Mbytes of SDRAM
- 512KB Flash memory for the bootstrap program
- RS232C controller
- Cyclone FPGA for decoding
- 4 IP slots to accommodate single / dual Industry Pack at 8 or 32 Mhz clock

### 2.1 THE 6713B BOOT PROCESS

The TMS320C6713/13B device has two boot modes: from the HPI or from external asynchronous FLASH EEPROM. On the TMS320C6713B, boot mode is determined during the device reset.

Refer to the TI application note spra512 for details on booting through the HPI.

When using the FLASH to boot, the first 1K of the FLASH are copied, starting to the local address 0x00000000 of the processor. After the end of the transfer, the CPU starts executing at the address 0. The small program thus loaded has the responsibility of doing at least a minimum configuration of 6713 registers and of copying a bigger program that will start executing and actually boot the board.

The board interface is configured as Big-Endian with the 8-bit data on the ED[31:24] side of the bus. HPI is always enabled

**J 4**

#### **BOOT CONFIGURATION**

No jumper

CE1 width 32-bit, HPI boot/Emulation boot

Jumper

CE1 width 16-bit, Asynchronous external ROM boot with default timings

### 2.2 RESET SCHEME

The TMS6713B-4PACK board has multiple source of reset. Upon Power-on a watch-dog timer provide a 200ms minimum delay where the DSP is maintained on reset. This gives each programmable logic chip enough time to get its program loaded.

The board can be reset by:

- Power-on reset
- PCI reset line /LRESET0 from PLX
- Push-button

All these methods use the watch-dog timer for delay.

### 3 6713 Local Peripherals

#### 3.1 6713 Internal registers

##### 3.1.1 EMIF programming

The board uses the 6713 EMIF module (External Memory Interface) to generate on-board timings.

Using the EMIF, the memory space is divided as:

MEMORY SPACE	SETTING	RESOURCE	SIZE	ADDRESS RANGE
CE0	0xffffbf33	SDRAM	8-32MB	0x80000000-0x81FFFFFF
CE1	0x12328620	ADD_ON + PERIPHERALS	4MB	0x90000000-0x903FFFFFF
CE2	0x12328610	IP MEMORY SPACE	4MB	0xA0000000-0xA31FFFFFF
CE3	0x12328610	FLASH (16-bit wide)	4MB	0xB0000000-0xB03FFFFFF

The default EMIF configuration in accordance with the PLL settings has been selected to give the maximum performance without sacrificing signal integrity. We recommend not changing it, as an incorrect setting will prevent the board from functioning properly.

Default EMIF configuration:

REGISTER	ADDRESS	SETTING
EMIF_GCTL	0x01800000	0x00000078
EMIF_CE0	0x01800008	0xffffbf33
EMIF_CE1	0x01800004	0x12328620
EMIF_CE2	0x01800010	0x12328610
EMIF_CE3	0x01800014	0x12328610
EMIF_SDRAMCTL	0x01800018	0x46216000
EMIF_SDRAMTIM	0x0180001C	0x00000618
EMIF_SDRAMEXT	0x01800020	0x00054529

### 3.1.2 PLL programming

The outside 48MHZ clock provided to the DSP is multiplied by the programmable internal PLL (x12) generating a 576 MHZ internal clock. This clock is then divided by two to provide SYSCLK or CLKOUT2 (288 MHZ).

The outside bus timings are generated by the TMS320C6713B EMIF using CLKOUT3 (the 576 MHZ clock divided by 6 by the PLL # 2) which is a 96 MHZ clock.

We strongly recommend using the default timings.

```

    *(int *)PLL_DIV2 = DIV_ENABLE + 3;
    *(int *)PLL_DIV1 = DIV_ENABLE + 1;
    *(int *)PLL_CSR &= ~CSR_PLLRST;

    /*-----*/
    /* Now enable pll path and we are off and running at */
    /* 300MHz with 100 MHz SDRAM. */
    /*-----*/
    *(int *)PLL_CSR |= CSR_PLEN;
}
```

### 3.2 CE0 space

The SDRAM is mapped in the CE0 space. Depending on your board options, up to 32 megabytes are available (4 megabytes is standard). The SDRAM is connected to the 6713B bus. The data and address buses are isolated to the local bus by buffers.

### 3.3 CE1 space

CE1 space is share between the boot flash, all peripherals including the ADD\_ON module.

PERIPHERALS	SIZE	ADDRESS RANGE
FLASH	2MB	0x90000000 - 0x901F FFFF
PLX_REG	1KB	0x902F E000 - 0x902F E3FF
SCC8530	1KB	0x902F E400 - 0x902F E7FF
CYCLONE REG	1KB	0x902F E800 - 0x902F EBFF

#### 3.3.1 FLASH EPROM

A 256Kx16 Flash memory [M29F400DB](#) is visible at the base address of CE1 (0x0x90000000) space for use during the boot process. It is also visible in CE3 (0xB0000000). The address space CE1 is 32-bit wide once the board has booted, so when accessing the FLASH, only the lower 16 bits of each 32-bit word contains actual data.

By contrast, the CE3 space is 16-bit wide, matching the FLASH actual geometry and the data is continuous.

#### 3.3.2 Local Registers

The cyclone logic has a set of locals registers used to set-up some local parameters or to communicate with the PLX bus.

##### 3.3.2.1 DSP\_CNTL0\_ADR 0x902F E800

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
		XRESET	NMIEN	x	FLASH_PAGE	!/LED_O[1]	!/LED_O[0]

/LED\_O[1..0]: This register controls 2 LEDs. The reset position is for the LEDs to be "off". A "1" in the position corresponding to the LED will set it "on".

FLASH\_PAGE: Currently unused, should be 0.

NMIEN: TMS320C6713B allows receiving the NMI interrupt from multiple sources. The default is 0: "disabled".

XRESET: A "1" will put the extended bus in a reset mode until it is cleared. The default is "no reset".

**3.3.2.2 DSP\_STAT0\_ADR 0x902F E804**

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
EVENT_LTCH	LINTO_LTCH		DSPNMI	RY_BY_FLASH	8530_IRQ	/LINTO	USERO

EVENT\_LTCH Status of the latched line Ext\_event line from PLX9056

LINTO\_LTCH Status of the latched line linto# from PLX9056

DSPNMI: Status of the PCI-generated bit to activate an NMI interrupt to the processor

RY\_BY\_FLASH Status of the RY\_BY pin from flash memory for use in its programming.

8530\_IRQ Status of interrupt from SCC8530: when the value is "0", the interrupt is active.

/LINTO Status of interrupt line activated by the PCI bus through the PLX 9056.

USERO Status of USERO line activated by the PCI bus through the PLX 9056.

**3.3.2.3 DSP\_CNTL1\_ADR 0x902F E808**

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
0	INT_8530_EN		LINTO_DIR				

LINTO\_DIR A "1" remove the direct connection of LINTO interrupt to the EXT\_NMI interrupt.

INT\_8530\_EN When set to "1" enables the 8530 interrupt as a source of the XINT\_INT6 - interrupt.

**3.3.2.4 DSP\_STAT1\_ADR 0x902F E80C**

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
		EXT_EVENTB					

EXT\_EVENTB Status of the DIRECT line Ext\_event line from PLX9056

**3.3.2.5 DSP\_CNTL2\_ADR 0x902F E810**

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
D_DSP7	D_DSP6	D_DSP5	D_DSP4	D_DSP3	D_DSP2	D_DSP1	D_DSP0

This register can be used as an inter-processor communication register with the PLX 9056.

**3.3.2.6 DSP\_STAT2\_ADR 0x902F E814**

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
P_CNT7	P_CNT6	P_CNT5	P_CNT4	P_CNT3	P_CNT2	P_CNT1	P_CNT0

This register can be used as an inter-processor communication register with the PLX 9056. Its value reflects what was written in the PCI\_CNTL1 register.

**3.3.2.7 DSP\_IPINT\_ADR 0x902F E820-E85C**

The TMS320C6713B supports 16 prioritized interrupts. In the present configuration, 5 interrupts are used by external hardware. Each interrupt can be programmed for edge/level and polarity. A set of multiplexer allocated the different source of interrupt to these 5 interrupts. See Interrupt registers details in the paragraph 3.3.3.

**3.3.2.8 DSP\_LINTI\_INTI 0x902F E840**

When DSP writes at this location, an interrupt is send to the HOST through the line /LINTI. The multiplexer must be set to "0". It is set to "0" upon reset.

**3.3.2.9 DSP\_LINTI\_RSTI 0x902F E844**

When the interrupt /LINTI is asserted, either the DSP or the PCI must write to this register. PCI\_LINTI\_RST located at Base + 0x10. The interrupt is also cleared the board reset.

**3.3.2.10 DSP\_CYC\_REV\_ADR 0x902F E860**

Unique 8 bits identifiers factory programmed within the Cyclone FPGA

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
0	0	0	0	0	0	0	1

**3.3.2.10.1 DSP\_PCB\_REV\_ADR[] 0x902F E864**

Unique 8 bits identifiers factory programmed within the Cyclone FPGA

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
1	0	1	0	1	0	1	0

### 3.3.3 Interrupt Registers

0xB010 0080- B010 009C

#### 3.3.3.1 DSP SOURCE OF INTERRUPT

The sole source of interrupts to the DSP are :

- The IP modules
- The serial port 8530
- The Host through the PLX 9056
- External event signal

External interrupt	Name source	Function
XINT[4]	IP INTERRUPTS	
XINT[5]	IP INTERRUPTS	
XINT[6]	/LINTO /INT85/EXT_EVENT	HOST through PLX /SCC8530/EXTERNAL SIGNAL
XINT[7]	IP INTERRUPTS	
NMI	/LINTO	HOST through PLX

**NOTE: THE INTERRUPT NEEDS TO BE PROGRAMMED FOR NEGATIVE EDGE DETECTION AT TMS320C6713B LEVEL**

#### 3.3.3.2 INTERRUPT TO HOST

The LINTI # line is the sole source for the local hardware to interrupt the HOST.

Multiplexer allows to enable one or more of these source to drive the LINTI# line.

- The IP modules
- The serial port 8530
- External event signal

### 3.3.4 PLX 9056 Registers

Base address: 0x902FFE000

The TMS320C6713B can access the PLX configurations registers at the following addresses.

NAME	PCI AD	LOCAL	FUNCTION
PCIIDR	00h	00h	PCI Configuration ID
PCICR	04h	04h	PCI Command

Detailed information can be found into the PLX 9056 data sheet.

### 3.3.5 RS-232C Port

Base address: 0x902FFE400  
Port A Control Register: 0x902FFE408  
Port A Data Register: 0x902FFE40C

The board uses the port A of a SCC85C230 to provide a serial interface. It use a 7.372800 MHz local clock oscillator. The port B has no outside connection.  
The interrupt from the serial controller is routed to the Cyclone to be shared with others interrupts source.

### 3.4 CE2 space

Base address :0xA0000000

The CE2 space is dedicated to the IP memory space. Total available addressing size is 4 Mbytes if the space is defined as 32 bit wide access or 2 Mbytes if the CE2 space is defined as 16 bits access. The DSP 6713B shifts the address lines accordingly.

Presently the space is defined as 16 bit access. Each Industry Pack module will then share 512k bytes of memory. To be able to access the full possibilities of the IP memory space (8 Mbytes) a paging register is used.

RESOURCE	ADDRESS RANGE 16 BITS	ADDRESS RANGE 32 BITS
IPA MEMORY SPACE	A000 0000- A007 FFFF	A000 0000- A00F FFFF
IPB MEMORY SPACE	A008 0000- A00F FFFF	A010 0000- A01F FFFF
IPC MEMORY SPACE	A010 0000- A017 FFFF	A020 0000- A02F FFFF
IPD MEMORY SPACE	A018 0000- A01F FFFF	A030 0000- A03F FFFF

### 3.5 CE3 space

Base address :0xB0000000

The CE3 is shared between the boot FLASH as a 16-bit space and the Industry Pack IO space. This allows to for instance running a program stored into it, or in general to access the data continuously. By contrast when accessing the same FLASH at the address 0x90000000, only 2 bytes are valid in each 4 bytes.

RESOURCE	ADDRESS RANGE
Boot Flash	B000 0000- B00F FFFF
IP Control/Status Registers	B010 0000- B010 07FF
IPA SPACE (ID,IO,INT,DMA)	B010 0800- B010 09FF
IPB SPACE (ID,IO,INT,DMA)	B010 0A00- B010 0BFF
IPC SPACE (ID,IO,INT,DMA)	B010 0C00- B010 0DFF
IPD SPACE (ID,IO,INT,DMA)	B010 0E00- B010 0FFF

## 4 PCI-Slave Address Map

### 4.1 PLX Address Map

### 4.2 Local Resources

There are 4 base address regions available on the PLX PCI9056. The **PCI-6713B\_4PACK** uses all 4 regions.

#### 4.2.1 Cyclone Registers

The HOST can access several registers located inside the CYCLONE FPGA.

These registers are used mainly to monitor the behavior of the board or to control and/or generate interrupt to the DSP. Details are provided above.

#### 4.2.1.1 PCI\_CNTL0 Base + 0x0

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
DSPNMI	USERI_O	HINTEN	0	0		DSPRST	0

*DSPNMI* A "1" generates an NMI interrupt to the TMS320C6713B. NMIEN bit must be selected.

*HINTEN* Host interrupt enable. This bit, when set to "1", allows the LINT1 signal to generate an interrupt on the PCI. The default is "disabled"

*DSPRST* When set to "1" by PCI will maintain the TMS320C6713B on reset mode. It needs to be set back to "0" to remove the DSP reset.

#### 4.2.1.2 PCI\_STAT0 Base + 0x4

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
0	N/A_	0	/LINTI			/LED_1_	/LED_0_

*/LINTI* Status of the interrupt request line LINTI to the PCI bus. When this bit is "0", an interrupt is requested. HINTEN must be enabled for this line to actually generate an interrupt on the PCI bus.

*DSP\_HINT* Status of TMS320C6713B generated HPI interrupt

*/LED\_0* Status of the LEDs controlled by the DSP. At reset, the LEDs are "off". A "1" will turn the corresponding LED "on".

*/LED\_1* Status of the LEDs controlled by the DSP. At reset, the LEDs are "off". A "1" will turn the corresponding LED "on".

#### 4.2.1.3 PCI\_CNTL1 Base + 0x8

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
P_CNT7	P_CNT6	P_CNT5	P_CNT4	P_CNT3	P_CNT2	P_CNT1	P_CNT0

The value written by the host in the PCI\_CNTL1 register can be read by the DSP in the DSP\_STAT2 register.

#### 4.2.1.4 PCI\_STAT1 Base + 0xC

ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
D_DSP7	D_DSP6	D_DSP5	D_DSP4	D_DSP3	D_DSP2	D_DSP1	D_DSP0

The value written in the *DSP\_CNTL2* register by the DSP can be read by the host in this register.

#### 4.2.1.5 PCI\_LINTI\_RST Base + 0x10

A write at this address by the host will de-assert the line */LINTI* that has generated an interrupt on the PCI bus.

#### 4.2.1.6 PCI\_DSP\_INT

Base + 0x14

Not used

#### 4.2.1.7 PCI\_CNTL2

Base + 0x18

This 32 bits registers is available on the PCI side only for manufacturing test.

### 4.2.2 DSP HPI Registers

The HOST through the PLX 9056 can access to all the resource of the board through the Host Port Interface bus or H.P.I. of the DSP. It is a 16 bit bus with only four (4) registers locations. As the TMS320C6713B is a 32bit machine, every access consists of two consecutive 16 bit half words. The two DSP signals *HCNTL1* and *HCNTL0* that select the type of access are automatically generated by the board logic from the address used.

BAR3 offset	HCNTL1	HCNTL0	Description
0x20000	0	0	Host reads from or writes to the HPI control register (HPIC).
0x20004	0	1	Host reads from or writes to the HPI address register (HPIA).
0x20008	1	0	Host reads from or writes to the HPI data register (HPID) in <i>auto increment</i> mode. The HPI address register (HPIA) is post incremented by a word address ( four bytes addresses)
0x2000C	1	1	Host reads from or writes to the HPI data register (HPID) in <i>fixed</i> address mode. The HPI address register (HPIA) is not affected.

```
typedef struct hpi_t {
    long ctrl;
    long addr;
    long data;
    long autoinc;
} hpi_t;
hpi_t *hpi;

ULONG readHPI(ULONG addr)
{
    int i = 10000;

    hpi->addr = addr;
    hpi->ctrl = 0x00110011;
    while ((hpi->ctrl & 8)&& (i--));          // wait for ready
    if (i == 0) printf("\nTimeout accessing the HPI and waiting for ready\n");
    return hpi->data;
}

void writeHPI(ULONG addr, ULONG data)
{
    int i = 10000;

    hpi->addr = addr & 0xffffffc;           // force a 32 bit boundary
    hpi->data = data;
    hpi->ctrl = 0x00110011;
    while ((hpi->ctrl & 8)&& (i--));          // wait for ready
    if (i == 0) printf("\nTimeout accessing the HPI and waiting for ready\n");
}
```

## 5 MAIN BOARD CONNECTORS

### 5.1 *Ps mode*

Pin	Signal name	Description
1	DCLK	Clock Signal
2	GND	Ground
3	CONF_DONE	Configuration done
4	VCC	Power supply
5	nCONFIG	Configuration control
6	NC	No connect
7	nSTATUS	Configuration status
8	NC	No connect
9	DATA0	Data to Device
10	GND	Ground

### 5.2 *Cyclone*

#### 5.2.1 USB Byteblaster

The two Cyclones can be programmed using the ByteBlaster.  
Connector P1 is used for the I/O CYCLONE.  
Connector P2 is used for the DSP CYCLONE.

J2 Pin	Signal
Pin 1	DCLK
Pin2	GND
Pin3	DONE
Pin4	+3.3V
Pin5	nCONFIG
Pin6	nCE
Pin7	Data0
Pin8	IO nCSO
Pin9	IO ASDO
Pin10	GND

**Table 5-1 ByteBlaster pod**

The ByteBlaster programs the serial EEPROM EPCS1 or EPCS4, then the Programmed data are transferred to the CYCLONE using Asynchronous Serial Mode.

## 6 Industry Pack

### 6.1 Board Control / Status Registers

The following locations are the Control / Status registers for the IP MODULES. Most of the registers are accessible to both the DSP and the HOST.

HOST Address BAR2:	DSP Address	Data	R/W	Description
0X00430XXX				IP BUS
	0XB0100004	D03-D00	R/W	IP memory page selection
	0XB0100008	N/A	WS	HOST Interrupt Acknowledge
	0XB0100010	D07-D00	R/W	IP Control/Status Register
	0XB0100014	D03-D00	R/W	Strobe Edge selection
	0XB0100020	N/A	WS	Next DMA End A
	0XB0100024	N/A	WS	Next DMA End B
	0XB0100028	N/A	WS	Next DMA End C
	0XB010002C	N/A	WS	Next DMA End D
	0XB0100030	N/A	WS	Clear BERR
	0XB0100038	N/A	WS	Software Strobe for manual clocking by DSP
	0XB0100040	D07-D00	R/W	Source selection for IPSTROBE_A and IPSTROBE_B
	0XB0100044	D07-D00	R/W	Source selection for IPSTROBE_C and IPSTROBE_D
	0XB0100048	D07-D00	R/W	Source selection for TINP_0 and TINP_1
	0XB0100060	N/A	WS	Clear Strobe
	0XB0100080	D07-D00	R/W	DSP Interrupt Enable Control register 0
	0XB0100084	D07-D00	R/W	DSP Interrupt Enable Control register 1
	0XB0100088	D07-D00	R/W	DSP Interrupt Enable Control register 2
	0XB010008C	D07-D00	W	IP RESET
	0XB0100090	D07-D00	R/W	DSP Interrupt Status register 0
	0XB0100094	D07-D00	R/W	DSP Interrupt Status register 1
	0XB0100098	D07-D00	R/W	DSP Interrupt Status register 2
	0XB010009C	D07-D00	R/W	DSP Interrupt Status register 0
	0XB01000A0	D07-D00	R/W	HOST Interrupt Enable Control register 0
	0XB01000A4	D07-D00	R/W	HOST Interrupt Enable Control register 1
	0XB01000A8	D07-D00	R/W	HOST Interrupt Enable Control register 2
	0XB01000B0	D07-D00	R/W	HOST Interrupt Status register 0
	0XB01000B4	D07-D00	R/W	HOST Interrupt Status register 1
	0XB01000B8	D07-D00	R/W	HOST Interrupt Status register 2

**Table 6.2: Control / Status Registers**

### 6.1.1 IP Memory Page selection

DSP Address: 0Xb0100004, Bits 03-00  
 PCI Address: BAR2:0x0430010, Bits 07-00  
 Mode of Access: Read/Write

The limited space available for the IP memory by the DSP require to use a paging mode to access the full 8 Mbytes.

IP MEMORY ACCESS TYPE	PAGE SIZE BY IP	ADDRESS	CONDITION	BIT 03	BIT 02	BIT 01	BIT 00
DSP 16 BITS	512K	\$A010 0000-\$A01F FFFF		XADR22	XADR21	XADR20	XADR19
DSP 32BITS	1 M	\$9030 0000-\$903F FFFF	SPLIT_MEM_DSP = "0"	XADR22	XADR21	XADR20	LA19
	2M		SPLIT_MEM_DSP = "1"	XADR22	XADR21	LA20	LA19
PLX 16 BITS	1M	\$0000 0000-\$001F FFFF		XADR22	XADR21	XADR20	AOA19
PLX 32 BITS	1M	\$0000 0000-\$001F FFFF	SPLIT_MEM_PLX = "0"	XADR22	XADR21	XADR20	AOA19
	2M	\$0000 0000-\$001F FFFF	SPLIT_MEM_PLX = "1"	XADR22	XADR21	AOA20	AOA19

### 6.1.2 HOST Interrupt Acknowledge

DSP Address: 0Xb0100008, Bits 03-00  
 PCI Address: Not Accessible  
 Mode of Access: Write Strobe

The DSP can write to this register to turn off the HOST interrupt generated by LINTI. It is intended for use by the HOST device driver.

### 6.1.3 IP Control Register

DSP Address: 0Xb0100010, Bits 07-00  
 PCI Address: BAR2:0x0430010, Bits 07-00  
 Mode of Access: Read/Write  
 Reset By: PCI Hardware Reset, Software Reset, Watchdog Reset

This register allows for setting the modes of access to the IPs.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP D CLOCK	IP C CLOCK	IP B CLOCK	IP A CLOCK	SPLIT_MEM_DSP	MEM_32CD_DSP	SPLIT_MEM_PLX	MEM_32CD_PLX

#### 6.1.3.1 MEM\_32CD\_PLX

This bit, when low (0), will the space allocated to the 32-bit interface IP\_MEMORY being exclusively for IP A\_B . When high (1), IP modules C\_D will be selected. Bit # 1 SPLIT\_MEM\_PLX must be set to "1".

### 6.1.3.2 SPLIT\_MEM\_PLX

This bit, when low (0), will allocated the 32-bit interface IP\_MEMORY space into two same size with address AOA[19] as switch.

### 6.1.3.3 MEM\_32CD\_DSP

This bit, when low (0), will the space allocated to the 32-bit interface IP\_MEMORY being exclusively for IP A\_B . When high (1), IP modules C\_D will be selected. Bit # 1 SPLIT\_MEM\_DSP must be set to "1".

See 32bit wide IP paragraph for more details

### 6.1.3.4 SPLIT\_MEM\_DSP

This bit, when low (0), will allocated the 32-bit interface IP\_MEMORY space into two same size with address LD[19] as switch.

See 32bit wide IP paragraph for more details

### 6.1.3.5 IP A CLOCK

This bit, when low (0), will clock IP module A at 8 MHz. When high (1), IP module A will be clocked at 32 MHz.

### 6.1.3.6 IP B CLOCK

This bit, when low (0), will clock IP module B at 8 MHz. When high (1), IP module B will be clocked at 32 MHz.

### 6.1.3.7 IP C CLOCK

This bit, when low (0), will clock IP module C at 8 MHz. When high (1), IP module C will be clocked at 32 MHz.

### 6.1.3.8 IP D CLOCK

This bit, when low (0), will clock IP module D at 8 MHz. When high (1), IP module A will be clocked at 32 MHz.

## 6.1.4 Strobe Edge selection

A "0" will enable a positive edge detection from the IPSTROBE signal.

A "1" will enable a negative edge detection from the IPSTROBE signal.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
				IP B STROBE	IP B STROBE	IP B STROBE	IP A STROBE

### 6.1.5 Next DMA End A,B,C,D

DSP Address: *0xb0100020,24,28,2C*

PCI Address: *Not Accessible*

Mode of Access: *Write Strobe*

According to the IP specification, the final DMA access of a transfer should occur with /IPDMAEND active low.

By writing to this location prior to the final IP DMA transfer, the IP DMA access will occur with /IPDMAEND active low. It is restored inactive high after the access.

If no significance to /IPDMAEND is required by the IP, then this protocol can be ignored.

### 6.1.6 Clear BERR

If an IP access times out due to an invalid access or some other problem, a status bit in IP Status Register is set. Writing to this location will clear those bits.

### 6.1.7 Software Strobe for manual clocking by DSP

### 6.1.8 DSP Interrupt Enable Control Register 0

DSP Address: 0Xb0100080  
PCI Address: BAR2: 0x0430080  
Mode of Access: Read/Write

This register selects the interrupt source for the DSP\_INT4 . The appropriate bit should be set (1) to allow that IP interrupt to trigger the DSP. When this bit is set, an interrupt will occur if an access to the corresponding IP resulted in a timeout. This would indicate a bad access on that IP.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP B, DMA1_ EN	IP B, DMA0_ EN	IP A, DMA1_ EN	IP A, DMA0_ EN	IP B, INT1 EN	IP B, INT0 EN	IP A, INT1 EN	IP A, INT0 EN

### 6.1.9 DSP Interrupt Enable Control Register 1

DSP Address: 0Xb0100084  
PCI Address: BAR2: 0x0430084  
Mode of Access: Read/Write

This register selects the interrupt source for the DSP\_INT5. The appropriate bit should be set (1) to allow that IP interrupt to trigger the DSP. When this bit is set, an interrupt will occur if an access to the corresponding IP resulted in a timeout. This would indicate a bad access on that IP.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP D, DMA1_ EN	IP D, DMA0_ EN	IP C, DMA1_ EN	IP C, DMA0_ EN	IP D, INT1 EN	IP D, INT0 EN	IP C, INT1 EN	IP C, INT0 EN

### 6.1.10 DSP Interrupt Enable Control Register 2

DSP Address: 0Xb0100088  
PCI Address: BAR2: 0x0430088  
Mode of Access: Read/Write

This register selects the interrupt source for the DSP\_INT6. The appropriate bit should be set (1) to allow that IP interrupt to trigger the DSP. When this bit is set, an interrupt will occur if an access to the corresponding IP resulted in a timeout. This would indicate a bad access on that IP.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
BERR D	BERR C	IP D STROBE	IP C STROBE	BERR B	BERR A	IP B STROBE	IP A STROBE

#### 6.1.11 IP RESET

*DSP Address:*            0Xb010008C  
*PCI Address:*            BAR2: 0x043008C  
*Mode of Access:*        Read Only

A write at this location will activated the IP reset line to “low” resetting the IP modules.

## 6.2 DSP Interrupt enable and source

Bit	Signal
0	Intreq_A0
1	Intreq_A1
2	Intreq_B0

DSP\_INT\_7

### 6.2.1 DSP Interrupt Status Register 0

DSP Address: 0Xb0100090  
 PCI Address: BAR2: 0x0430090  
 Mode of Access: Read Only

This register allows the DSP interrupt routine for DSP\_INT4 to determine which of the IPs are causing an interrupt.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP B, DMA1	IP B, DMA0	IP A, DMA1	IP A, DMA0	IP B, INT1	IP B, INT0	IP A, INT1	IP A, INT0

When the applicable bit is low (0), the IP is asserting the /INT line.

The interrupt routine must ensure that all interrupts have been cleared prior to returning. Since the DSP interrupt must be pulsed, the logic only generates a pulse when the transition from no interrupts are asserted, to at least one interrupt is asserted.

### 6.2.2 DSP Interrupt Status Register 1

DSP Address: 0Xb0100094  
 PCI Address: BAR2: 0x0430094  
 Mode of Access: Read Only

This register allows the DSP interrupt routine for DSP\_INT4 to determine which of the IPs are causing an interrupt.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP D, DMA1	IP D, DMA0	IP C, DMA1	IP C, DMA0	IP D, INT1	IP D, INT0	IP C, INT1	IP C, INT0

When the applicable bit is low (0), the IP is asserting the /INT line.

The interrupt routine must ensure that all interrupts have been cleared prior to returning. Since the DSP interrupt must be pulsed, the logic only generates a pulse when the transition from no interrupts are asserted, to at least one interrupt is asserted.

### 6.2.3 DSP Interrupt Status Register 2

DSP Address: 0Xb0100098  
 PCI Address: BAR2: 0x0430098  
 Mode of Access: Read Only

This register allows the DSP interrupt routine for DSP\_INT4 to determine which of the source's are causing an interrupt.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
BERR D	BERR C	STROBE D	STROBE C	BERR B	BERR A	STROBE B	STROBE A

When the applicable bit is low (0), the IP is asserting the /INT line.

The interrupt routine must ensure that all interrupts have been cleared prior to returning. Since the DSP interrupt must be pulsed, the logic only generates a pulse when the transition from no interrupts are asserted, to at least one interrupt is asserted.

This bit is cleared by writing to Clear BERR/STROBE.

### 6.3 HOST Interrupt Enable

#### 6.3.1 HOST Interrupt Enable Control Register 0

DSP Address: 0Xb01000A0  
 PCI Address: BAR2: 0x04300A0  
 Mode of Access: Read/Write

The sole external source line use to interrupt the HOST is LINTI #.

Each of the IP interrupt lines or DMA request lines can be selected to generate an interrupt to the HOST.

Also a DSP to HOST strobe pulse can generate an interrupt to the HOST.

This register selects the interrupt source for the LINTI #. The appropriate bit should be set (1) to allow that IP interrupt to trigger the HOST.

When this bit is set, an interrupt will occur if an access to the corresponding IP resulted in a timeout. This would indicate a bad access on that IP.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP B, DMA1_ EN	IP B, DMA0_ EN	IP A, DMA1_ EN	IP A, DMA0_ EN	IP B, INT1 EN	IP B, INT0 EN	IP A, INT1 EN	IP A, INT0 EN

### 6.3.2 HOST Interrupt Enable Control Register 1

DSP Address: 0Xb01000A4

PCI Address: BAR2: 0x04300A4

Mode of Access: Read/Write

This register selects the interrupt source for the the LINTI #. The appropriate bit should be set (1) to allow that IP interrupt to trigger the DSP.

When this bit is set, an interrupt will occur if an access to the corresponding IP resulted in a timeout. This would indicate a bad access on that IP.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP D, DMA1_ EN	IP D, DMA0_ EN	IP C, DMA1_ EN	IP C, DMA0_ EN	IP D, INT1 EN	IP D, INT0 EN	IP C, INT1 EN	IP C, INT0 EN

### 6.3.3 HOST Interrupt Enable Control Register 2

DSP Address: 0Xb01000A8

PCI Address: BAR2: 0x04300A8

Mode of Access: Read/Write

This register selects the interrupt source for the the LINTI #. The appropriate bit should be set (1) to allow that IP interrupt to trigger the DSP.

When this bit is set, an interrupt will occur if an access to the corresponding IP resulted in a timeout. This would indicate a bad access on that IP.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
BERR D	BERR C	IP D STROBE	IP C STROBE	BERR B	BERR A	IP B STROBE	IP A STROBE

### 6.3.4 HOST Interrupt Status Register 0

DSP Address: 0Xb01000B0

PCI Address: BAR2: 0x0430B0

Mode of Access: Read Only

This register allows the DSP interrupt routine for the LINTI # to determine which of the IPs are causing an interrupt.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP B, DMA1	IP B, DMA0	IP A, DMA1	IP A, DMA0	IP B, INT1	IP B, INT0	IP A, INT1	IP A, INT0

When the applicable bit is low (0), the IP is asserting the /INT line.

The interrupt routine must ensure that all interrupts have been cleared prior to returning. Since the DSP interrupt must be pulsed, the logic only generates a pulse when the transition from no interrupts are asserted, to at least one interrupt is asserted.

### 6.3.5 HOST Interrupt Status Register 1

DSP Address: 0Xb01000B4

PCI Address: BAR2: 0x04300B4

Mode of Access: Read Only

This register allows the DSP interrupt routine for the LINTI # to determine which of the IPs are causing an interrupt.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
IP D, DMA1	IP D, DMA0	IP C, DMA1	IP C, DMA0	IP D, INT1	IP D, INT0	IP C, INT1	IP C, INT0

When the applicable bit is low (0), the IP is asserting the /INT line.

The interrupt routine must ensure that all interrupts have been cleared prior to returning. Since the DSP interrupt must be pulsed, the logic only generates a pulse when the transition from no interrupts are asserted, to at least one interrupt is asserted.

### 6.3.6 HOST Interrupt Status Register 2

DSP Address: 0Xb01000B8

PCI Address: BAR2: 0x04300B8

Mode of Access: Read Only

This register allows the DSP interrupt routine for the LINTI # to determine which of the source's are causing an interrupt.

BIT 07	BIT 06	BIT 05	BIT 04	BIT 03	BIT 02	BIT 01	BIT 00
BERR D	BERR C	STROBE D	STROBE C	BERR B	BERR A	STROBE B	STROBE A

When the applicable bit is low (0), the IP is asserting the /INT line.

The interrupt routine must ensure that all interrupts have been cleared prior to returning. Since the DSP interrupt must be pulsed, the logic only generates a pulse when the transition from no interrupts are asserted, to at least one interrupt is asserted.

This bit is cleared by writing to Clear BERR/STROBE.

## 6.4 IP module address map

HOST Address BAR2:	DSP Address	Data	R/W	Description
0X00430800	0XB0100800	D07-D00	R/W	IP A IDSPACE 16 bit

**Table 6.3: IP SPACE Registers**

#### **6.4.1 IP A 16-Bit ID Access**

*DSP Address:* 0Xb0100800 – 0Xb010087f, Bits 15-00

*PCI Address:* BAR2: 0x0430000– 0x043007f

*Mode of Access:* Read / Write

Access to these locations generates a valid IP ID SPACE cycles to IP A.

#### **6.4.2 IP A Interrupt Acknowledge**

*DSP Address:* 0Xb0100880 – 0Xb010087f, Bits 15-00

*PCI Address:* Not Accessible

*Mode of Access:* Read / Write

Reading from this location generates a valid IP Interrupt Acknowledge cycle to IP A.

0Xb0100880 issues an acknowledge to IP INT0, and 0Xb0100884 issues an acknowledge to IP INT1.

Note that this is not required by the carrier, and is only supported for those IP modules requiring it.

#### **6.4.3 IP A 16-Bit IO Access**

*DSP Address:* 0Xb0100900 – 0Xb010097f

*PCI Address:* BAR2: 0x0430100– 0x043017f

*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP A.

#### **6.4.4 IP A 16-Bit IO Access DMA**

*DSP Address:* 0Xb0100980 – 0Xb01009ff

*PCI Address:* BAR2: 0x0430100– 0x043017f

*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP A.

#### **6.4.5 IP B 16-Bit ID Access**

*DSP Address:* 0Xb0100a00 – 0Xb0100a7f

*PCI Address:* BAR2: 0x0430200– 0x043027f

*Mode of Access:* Read / Write

Access to these locations generates a valid IP ID SPACE cycles to IP B.

#### **6.4.6 IP B Interrupt Acknowledge**

*DSP Address:* 0Xb0100A80 – 0Xb0100A7f, Bits 15-00

*PCI Address:* Not Accessible

*Mode of Access:* Read / Write

Reading from this location generates a valid IP Interrupt Acknowledge cycle to IP A.

0Xb0100980 issues an acknowledge to IP INT0, and 0Xb0100984 issues an acknowledge to IP INT1.

Note that this is not required by the carrier, and is only supported for those IP modules requiring it.

#### **6.4.7 IP B 16-Bit IO Access**

*DSP Address:* 0Xb0100b00 – 0Xb0100b7f

*PCI Address:* BAR2: 0x0430300– 0x043037f

*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP B.

#### **6.4.8 IP B 16-Bit IO Access DMA**

*DSP Address:* 0Xb0100b80 – 0Xb0100bff

*PCI Address:* BAR2: 0x0430300– 0x043037f

*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP B.

#### **6.4.9 IP C 16-Bit ID Access**

*DSP Address:* 0Xb0100c00 – 0Xb0100c7f  
*PCI Address:* BAR2: 0x0430400– 0x043047f  
*Mode of Access:* Read / Write

Access to these locations generates a valid IP ID SPACE cycles to IP C.

#### **6.4.10 IP C Interrupt Acknowledge**

*DSP Address:* 0Xb0100C80 – 0Xb0100C7f, Bits 15-00  
*PCI Address:* Not Accessible  
*Mode of Access:* Read / Write

Reading from this location generates a valid IP Interrupt Acknowledge cycle to IP A.

0Xb0100C80 issues an acknowledge to IP INT0, and 0Xb0100C84 issues an acknowledge to IP INT1.

Note that this is not required by the carrier, and is only supported for those IP modules requiring it.

#### **6.4.11 IP C 16-Bit IO Access**

*DSP Address:* 0Xb0100d00 – 0Xb0100d7f  
*PCI Address:* BAR2: 0x0430400– 0x043047f  
*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP C.

#### **6.4.12 IP C 16-Bit IO Access DMA**

*DSP Address:* 0Xb0100d80 – 0Xb0100dff  
*PCI Address:* BAR2: 0x0430400– 0x043047f  
*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP C.

#### **6.4.13 IP D 16-Bit ID Access**

*DSP Address:* 0Xb0100e00 – 0Xb0100e7f  
*PCI Address:* BAR2: 0x0430600– 0x043067f  
*Mode of Access:* Read / Write

Access to these locations generates a valid IP ID SPACE cycles to IP D.

#### **6.4.14 IP D Interrupt Acknowledge**

*DSP Address:* 0Xb0100E80 – 0Xb0100E7f, Bits 15-00  
*PCI Address:* Not Accessible  
*Mode of Access:* Read / Write

Reading from this location generates a valid IP Interrupt Acknowledge cycle to IP A.

0Xb0100E80 issues an acknowledge to IP INT0, and 0Xb0100E84 issues an acknowledge to IP INT1.

Note that this is not required by the carrier, and is only supported for those IP modules requiring it.

#### **6.4.15 IP D 16-Bit IO Access**

*DSP Address:* 0Xb0100f00 – 0Xb0100f7f  
*PCI Address:* BAR2: 0x0430700– 0x043077f  
*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP D.

#### **6.4.16 IP D 16-Bit IO Access DMA**

*DSP Address:* 0Xb0100f80 – 0Xb0100fff  
*PCI Address:* BAR2: 0x0430700– 0x043077f  
*Mode of Access:* Read / Write

Access to these locations generates a valid IP IO SPACE cycles to IP D.

### 6.4.17 IP MEM BANK SELECTION

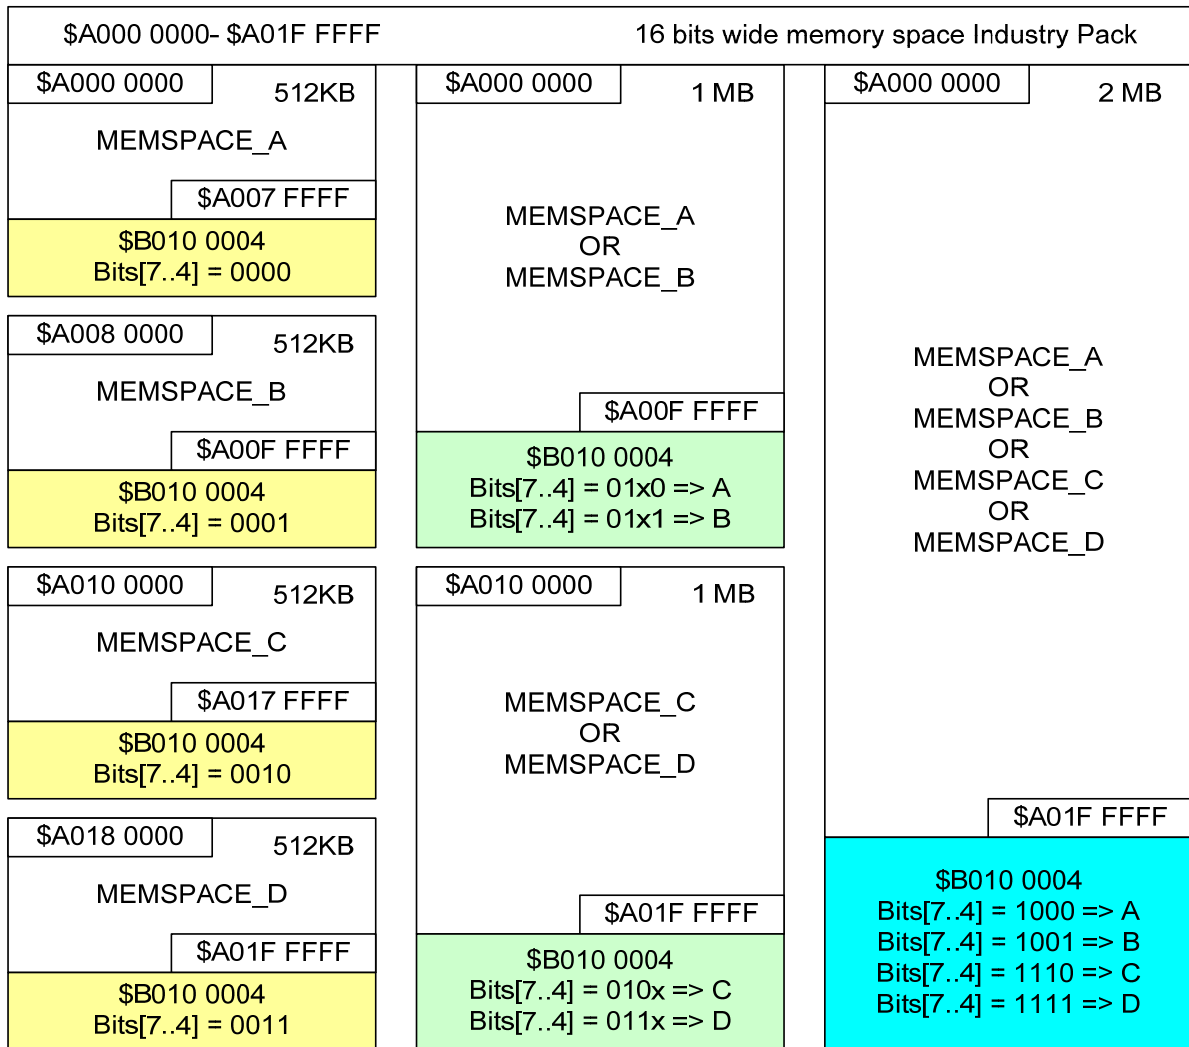

Space addressing limitations of the TMS320C6713B, request an smaller allocation of memory than the IPO specification allowed( 8 Mbytes). .

To allow access to larger MEM area, the board implements a paging mechanism. By setting these bits to the appropriate value, MEM spaces of up to 8 megabytes can be used.

DSP Address: 0Xb0100004  
 PCI Address: BAR2: 0x04300cc  
 Mode of Access: Read / Write  
 Reset By: PCI Hardware Reset, Software Reset, Watchdog Reset

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
MEM_SLT # 7	MEM_SLT # 6	MEM_SLT # 5	MEM_SLT # 4	ADDR #22	ADDR #21	ADDR #20	ADDR #19

### 6.4.18 16 bits wide IP

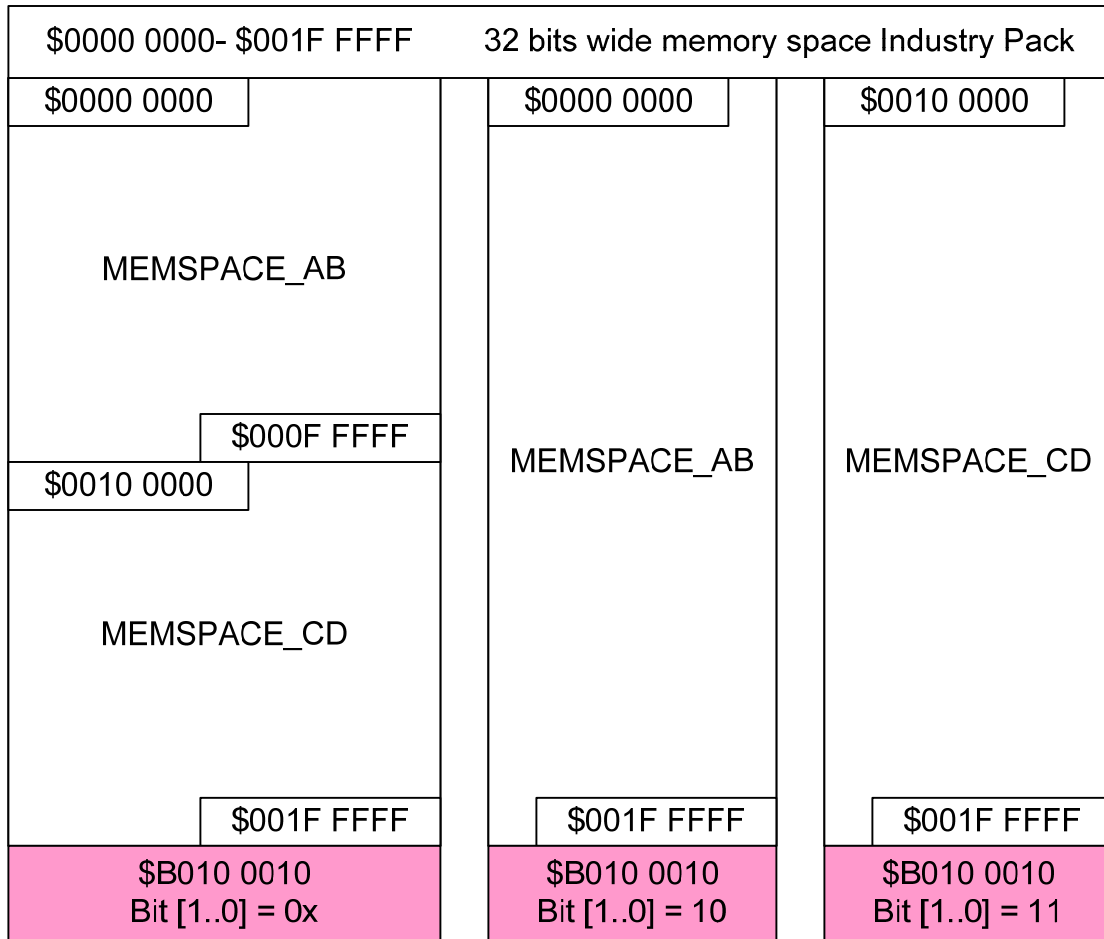

**6.4.19 32 bits wide IP**

DSP Address: 0Xb0100010  
 PCI Address: BAR2: 0x04300cc  
 Mode of Access: Read / Write  
 Reset By: PCI Hardware Reset, Software Reset, Watchdog Reset

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
IPD_32	IPC_32	IPB_32	IPA_32	SPLIT_MEM_DSP	MEM_32CD_DSP	SPLIT_MEM_PLX	MEM_32CD_PLX

#### 6.4.20 IP A 16-Bit MEM Access

DSP Address: 0xa0000000 – 0xa007ffff

PCI Address: BAR3: 0x0000000– 0x0ffff

Mode of Access: Read / Write

Access to these locations generates a valid IP MEM SPACE cycles to IP A.

#### 6.4.21 IP B 16-Bit MEM Access

DSP Address: 0xa0080000 – 0xa00ffff

PCI Address: BAR3: 0x100000– 0x1ffff

Mode of Access: Read / Write

Access to these locations generates a valid IP MEM SPACE cycles to IP B.

#### 6.4.22 IP C 16-Bit MEM Access

DSP Address: 0xa0100000 – 0xa017ffff

PCI Address: BAR3: 0x200000– 0x2ffff

Mode of Access: Read / Write

Access to these locations generates a valid IP MEM SPACE cycles to IP C.

#### 6.4.23 IP D 16-Bit MEM Access

DSP Address: 0xa0180000 – 0xa01ffff

PCI Address: BAR3: 0x300000– 0x3ffff

Mode of Access: Read / Write

Access to these locations generates a valid IP MEM SPACE cycles to IP D.

#### 6.4.24 Software Strobe for manual clocking by DSP

DSP Address: 0xb0100038  
PCI Address: Not Accessible  
Mode of Access: Write Strobe

A write to this location can potentially trigger a conversion or other event if selected in the **Clock / INT Configuration Registers**.

#### 6.4.25 Clock / INT Configuration Registers

DSP Address: 0xb0100040 – 0xb010005c, Bits 07 – 00  
PCI Address: Not Accessible  
Mode of Access: Mixed  
Reset By: PCI Hardware Reset, Software Reset,  
Watchdog Reset

These registers control the External trigger and IPstrobe signals (4) from the IP module signal routing inside the card, as well as allow for the control and monitoring of the EXT trigger line. All of the registers are read/write, except for the EXT monitoring bits, which are read only.

A 4 pin connector J3 provide the following signal to/from the external environment.

J3	Signal	Type
Pin 1	External Event	Input (negative pulse)
Pin 2	Buffered DSP timer #0	Output
Pin 3	Buffered Strobe Out	Output
Pin 4	GND	Ground

Each of the IPSTROBE can be selected as the destination or the source for the others IPSTROBE, External trigger or DSP Software Strobe.  
 The IPSTROBE selected as output must have then Bit # 3 IPSTROBE EN must be high (1). If the IP generates IPSTROBE, then Bit # 3 should be low (0).

### IPSTROBE\_A

DSP Address: *0xb0100040 – Bits 00 – 03*  
 PCI Address: *Not Accessible*  
 Mode of Access: *Mixed*  
 Reset By: *PCI Hardware Reset, Software Reset, Watchdog Reset*

Bit # 3 is set to “1” to enable the IPSTROBE as Output.

Bit[3..0]	Signal
x8	DSP_STROBE
x9	TIMER_0
xA	TIMER_1
xB	GND
xC	IPSTROBE_B
xD	IPSTROBE_C
xE	IPSTROBE_D
xF	EXT_EVENTB
DSP	\$B0100040

### 6.4.25.1 DSP Tinutp #0 Input Source

The DSP TMS320C6713B has two input lines used for timer #0 or different interrupts.

DSP Address: *0xb0100048 – Bits 00 – 03*  
PCI Address: *Not Accessible*  
Mode of Access: *Mixed*  
Reset By: *PCI Hardware Reset, Software Reset, Watchdog Reset*

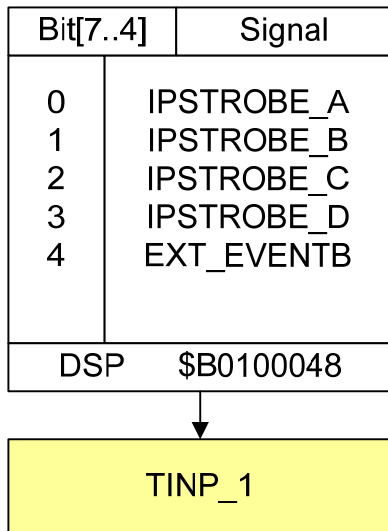

**Table 6.8: Source for Tinutp # 0**

### 6.4.25.2 DSP Tinutp # 1 Input Source

The DSP TMS320C6713B has two input lines that can be source for timer #0 and timer#1 or different interrupts.

DSP Address: *0xb0100044 – Bits 07 – 04*  
 PCI Address: *Not Accessible*  
 Mode of Access: *Mixed*  
 Reset By: *PCI Hardware Reset, Software Reset, Watchdog Reset*

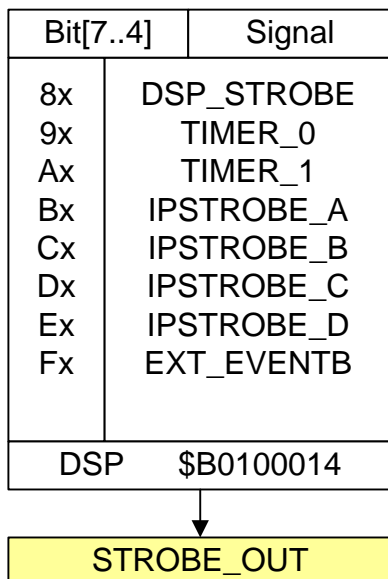

**Table 6.9: Source for Tinput # 1**

#### 6.4.25.3 EXT STROBE Direct Output J4

DSP Address: *0xb0100014, Bits 07 – 04*  
 PCI Address: *Not Accessible*  
 Mode of Access: *Read/Write*  
 Reset By: *PCI Hardware Reset, Software Reset, Watchdog Reset*

The EXT Trigger can be driven to a specific logic state for gating or other applications.

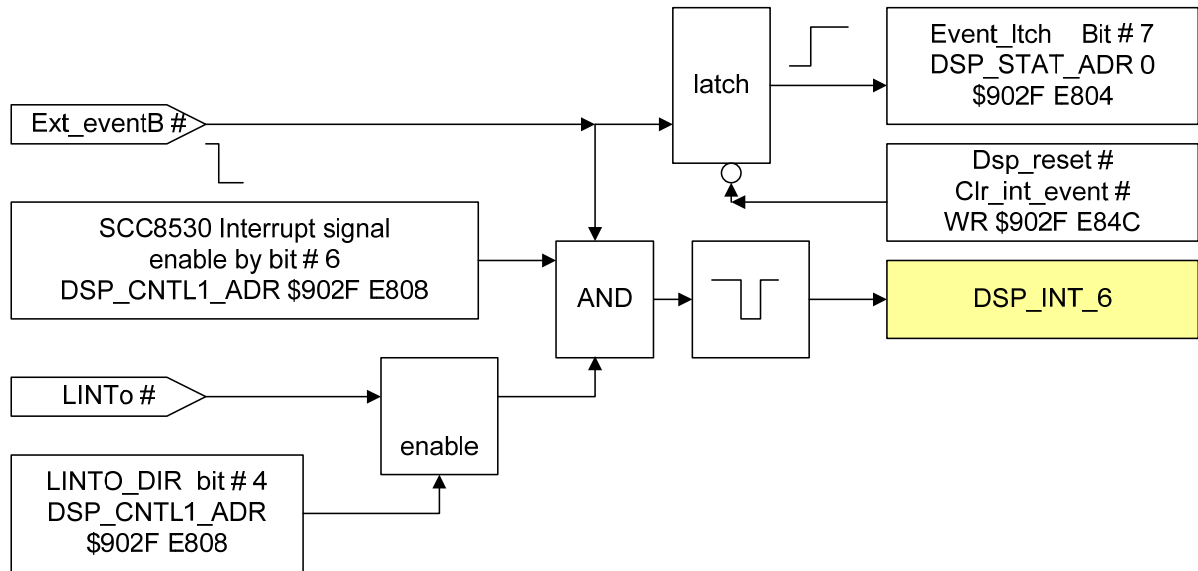

### 6.4.25.4 EXT\_EVENTB and LINTO # Monitor

The LINTO # direct signal status can be know at:

DSP\_STAT0\_ADR               \$902F E804               bit #1

The EXT\_EVENTB signal direct signal status can be know at:

DSP\_STAT1\_ADR               \$902F E80C               bit #5

BIT #	Source	ADDRESS	RESET
1	EXT_EVENTB	\$902F E80C	
0	LINTO #	\$902F E804	

\$902F E848  
\$902F E84C

These bits reflect the current state of the EXT Trigger line.
